Adobe has been racing hard to stay the market leader. Mainly, what they offer today, in comparison to competition like Photoshop, is a bundle of features and tools. What nearly every other competitor now offers is simply improving speed and de-cluttering more complex processes. I actually made some money for Adobe in 2013 by promoting Lightroom as a faster Photoshop alternative for folks who don't want to spend a fortune. The downside was that the company apparently did not get the message that speed and efficiency, not bloated features and lots of options, are the future. Today, the Photoshop team has pulled out all the stops to release a software release that has many advanced features and not enough simplicity. Just like Lightroom, Photoshop generates stacks of information in the background. Saving a new version always generates files with new metadata. Sometimes, this is needed to allow a single user to share a folder with multiple parties. A few software creators, such as one of my favourites, Adobe LiveCycle, actually create more data because they need that data for each user, even though some of it is duplicated. This is surely not something we want. It's time for a team of developers to adopt some best practice guidelines that developers use everywhere today in terms of information management and database structure. Like any good salesperson, Adobe should encourage their clients to spend money on a yearly subscription plan. Why not continue to charge for a

perpetual license, but offer customers a discount to extend a subscription? I know you probably will not listen to advice like this, but we have some clients who would pay better in monthly fees just to get the stuff.

While most people use Adobe Photoshop for photography purposes and editing - it's a powerful tool that can be used in other areas as well. The Adobe Photoshop team have written in the official blog that they tried to bring the tool to the web based on “what practical benefits do web-based applications have today and what will they have tomorrow”. These include things such as porting webAssembly and Flash , Flex and FlexRunner components, Studio , as well as the Mobile and Device Adobe CC applications. The team also wrote that they did not expect advertisers to run Photoshop in the Advertise section of the web browser, as well as on the more complex areas such a Video section. Up until now, Adobe's official website has also only been able to run in browsers that support the HTML5 CSS Canvas and JavaScript APIs. Adobe's version of Photoshop, Web-Illustrator, recently became the first Adobe software to run in WebAssembly Flex and FlexRunner browsers and Adobe's Emscripten compiler or in browsers that have JavaScript or Canvas basic support. The team is also optimizing the library so it's able to run in other browsers and sensors. The Adobe Photoshop team are now inviting everyone to try out the new site — **beginning today**. Along with different effects and tools, Adobe Photoshop has other features that you might want to take advantage of. Not only does it have filters, but it comes with a variety of filters.
